

Project Design Phase Solution Architecture

Date	3 October 2026
Team ID	SWTID-2026-4089
Project Name	Auto Ticket Classification Using Floor Designer
Maximum Marks	4 Marks

Solution Architecture:

Auto ticket classification uses a designer-built workflow to inspect incoming support requests, identify their intent and urgency, and route them to the right team. Its goals are to:

- Capture new tickets and normalize key fields such as subject, description, requester, and service.
- Apply configured rules to assign category, subcategory, priority, and the responsible support group.
- Route classified tickets, notify assignees, and update ticket fields with a traceable decision record.
- Send uncertain or unmatched requests to a human triage queue for review and correction.

Example - Auto Ticket Classification Flow:

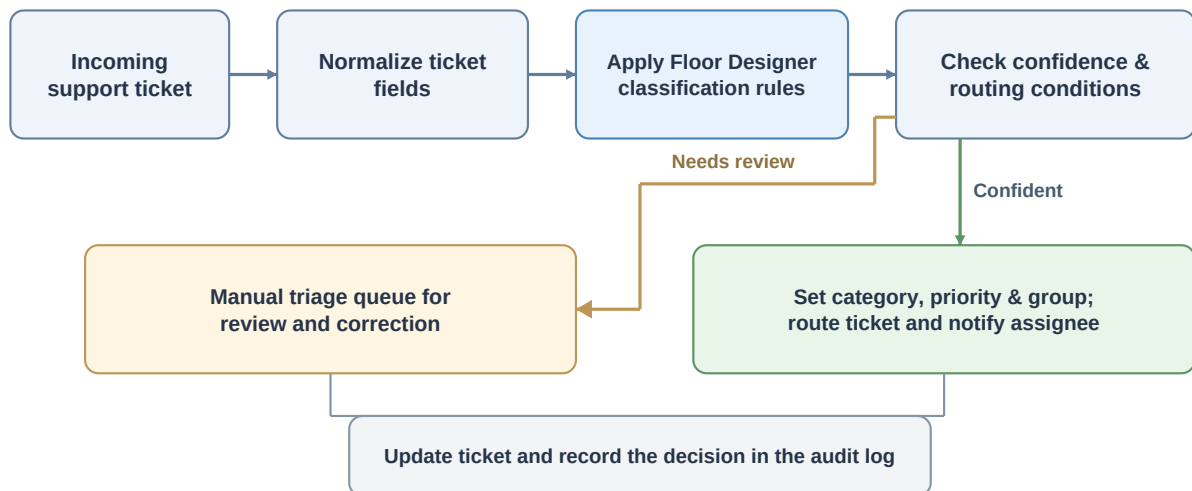

Figure 1: Designer-based workflow for classifying and routing incoming support tickets

Design note: Classification rules, confidence thresholds, and routing groups are configured in Floor Designer.
