

Project Design Phase

Problem – Solution Fit Template

Date	3 October 2026
Team ID	SWTID-2026-4089
Project Name	Auto Ticket Classification Using Floor Designer
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The project hypothesis is that support teams lose time when incoming tickets are manually interpreted, categorized, and routed. A Floor Designer workflow could reduce inconsistent triage by applying configured classification rules and sending uncertain cases to human review. Validate this fit with support agents and ticket data.

Purpose:

- ☐ Reduce time agents spend reading and assigning routine tickets.
- ☐ Improve consistency of ticket category, priority, and assignment group.
- ☐ Route common requests promptly while keeping uncertain cases for human review.
- ☐ Make classification decisions traceable so agents can understand and correct them.
- ☐ Validate fit using accuracy, time-to-assignment, reroute rate, and manual-review share.

Template:

CUSTOMER & CONTEXT	Customer segments Primary: service-desk agents and IT support teams handling high ticket volumes. End users submit incidents and service requests.	Customer constraints Limited triage time; incomplete or inconsistent descriptions; existing categories, escalation policies, and routing rules must be respected.	Current alternatives Manual assignment, keyword rules, or fixed queues. These can be inconsistent when ticket wording varies or categories overlap.
PROBLEM FIT	Jobs to be done Understand each new request, choose its category and urgency, and get it to the right support group quickly.	Problem / root causes Free-text tickets, missing fields, overlapping categories, and routing knowledge held by individual agents create rework and misroutes.	Current behavior Agents read the subject and description, infer intent and priority, assign a queue, then reassign tickets when the first choice is wrong.
SOLUTION FIT	Triggers A new portal or email ticket arrives; required fields are missing; queues grow; or tickets are repeatedly reassigned.	Proposed solution Floor Designer workflow: normalize fields, apply configurable rules, set category, priority, and group, then route and notify. Low-confidence cases go to triage.	Channels & measures Run on configured ticket intake channels. Track classification accuracy, time-to-assignment, reroute rate, and share sent for manual review.
