

Project Design Phase
Proposed Solution Template

Date	03 October 2026
Project ID	SWTID-2026-4089
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Support teams receive large volumes of tickets with inconsistent descriptions. Manual classification causes delays, incorrect routing, missed priorities, and poor customer visibility.
2.	Idea / Solution description	Use ServiceNow Flow Designer to trigger an automated workflow when a ticket is created or updated. The flow validates the request, classifies the issue, sets priority, assigns the correct group, notifies stakeholders, and records an audit trail.
3.	Novelty / Uniqueness	Combines configurable decision rules, keywords, knowledge context, confidence-based suggestions, and human feedback in one reusable Flow Designer process.
4.	Social Impact / Customer Satisfaction	Reduces response delays, gives customers faster and more consistent support, improves transparency through status updates, and allows agents to correct classifications.
5.	Business Model (Revenue Model)	Offered as a subscription or service-management add-on priced by users, ticket volume, or automation features; enterprise plans can include integrations, analytics, and support.
6.	Scalability of the Solution	Reusable subflows, queues, asynchronous actions, and modular rules allow new categories, channels, teams, and higher ticket volumes to be added without redesigning the whole solution.
