

Acceptance Testing

UAT Execution & Report Submission

Date	03 October 2026
Team ID	SWTID-2026-4089
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to define the User Acceptance Testing (UAT) coverage for the **Auto Ticket Classification Using Flow Designer** project. The report describes the intended validation of ticket classification, category assignment, assignment-group routing, record updates, and fallback handling when a ticket does not match a configured rule.

2. Defect Analysis

This section records defects identified during UAT execution. As no execution results or defect log were provided with the project submission, the initial status is recorded as no defects reported. The table should be updated when UAT cases are executed.

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
Open / Pending UAT	0	0	0	0	0
Fixed	0	0	0	0	0
Not Reproduced	0	0	0	0	0
Deferred / Won't Fix	0	0	0	0	0
Totals	0	0	0	0	0

Current defect status: No defects reported at the time of document preparation.

3. Test Case Analysis

The following UAT cases validate the end-to-end behavior of the ServiceNow Flow Designer flow. Cases are marked **Not Tested** until execution evidence is recorded.

Test Case	Expected Validation	Status
TC-01: Flow trigger	A newly created ticket triggers the Flow Designer flow automatically.	Not Tested
TC-02: Network classification	A network-related description receives the configured category and Network Support assignment group.	Not Tested
TC-03: Hardware classification	A hardware-related description receives the configured category and Hardware Support assignment group.	Not Tested
TC-04: Access classification	An access-related description is routed to the configured IT support group.	Not Tested
TC-05: Email classification	An email-related description receives the configured category and assignment group.	Not Tested
TC-06: Record update	The ticket category and assignment group fields are updated without altering unrelated ticket data.	Not Tested
TC-07: Unmatched ticket fallback	An unmatched description follows the fallback path and remains available for manual review.	Not Tested
TC-08: Repeatability	Equivalent ticket descriptions produce consistent classification results on repeated runs.	Not Tested

4. UAT Acceptance Criteria

Criterion	Acceptance Condition
Trigger	The flow starts when a new support ticket is created.
Classification	Configured ticket descriptions are classified into the expected category.
Routing	The ticket is assigned to the correct support group.
Fallback	Tickets with no matching rule are retained or routed for manual review.
Data integrity	Only intended ticket fields are changed by the flow.

5. UAT Conclusion

The UAT plan provides coverage for the key business behavior of Auto Ticket Classification Using Flow Designer. Final acceptance should be recorded after the test cases are executed in the ServiceNow environment and the corresponding screenshots or execution evidence are attached. Any failed case should be entered in the defect analysis table with its severity, resolution, and retest status.
